

AGENT R AUTOMATION

MVP Proposal & Pilot Plan

AI-Assisted Reel Production Workflow

Purpose

This document defines the Agent R MVP scope, success metrics, human-in-the-loop controls, test evidence, risks, and scale decision rule for a controlled AI-assisted reel production workflow.

Document Field	Details
Prepared for	Client Review
Prepared by	Agent R Product Team
Document Type	MVP Proposal and Pilot Plan
MVP Evidence	Initial internal test across 10 sample videos
Decision Required	Approve controlled pilot and measurement plan
Version / Date	Version 1.0 23 June 2026

1. Executive Summary

Agent R currently requires multiple manual steps to convert a raw story or concept into a reel-ready draft. The process includes research review, script writing, scene planning, image prompt creation, visual generation, dialogue timing, draft preparation, and final review.

The proposed MVP tests whether an AI-assisted workflow can reduce repetitive production effort while keeping creator judgment, factual review, and final approval fully human-controlled.

The MVP has been internally tested across 10 sample videos to evaluate workflow feasibility, output quality, creator review needs, and areas of rework. The purpose is not to fully automate content creation, but to create a structured, repeatable workflow that helps move from raw idea to creator-approved draft faster and more consistently.

2. Problem Statement

Reel production is currently limited by repeated manual effort across multiple stages. Even when the creator already knows the story, preparing a usable reel draft still requires time-consuming work.

The core problem is not only slow reel creation. The deeper problem is that raw ideas are not becoming creator-review-ready drafts fast enough.

Current Manual Workflow Step	Current Challenge
Research review	Time-consuming information gathering and verification
Script writing	Repetitive first-draft effort for every story
Scene breakdown	Manual planning for each visual moment
Image prompt writing	Prompts must be created individually for every scene
Visual selection	Mismatched visuals can create rework
Draft preparation	Multiple content pieces must be coordinated manually
Final review	Creator must check facts, tone, pacing, and visuals

Before vs After

Area	Current Manual Process	MVP Target
Draft preparation time	Approx. 3.5–6+ hours	1.5–3 hours
Script writing	Fully manual	AI-assisted draft with creator review
Scene planning	Manual	AI-generated scene breakdown
Image prompt writing	Manual for each scene	AI-generated editable prompts

Area	Current Manual Process	MVP Target
Rework	Inconsistent and stage-heavy	Reduced through review checkpoints
Weekly draft capacity	Limited by manual effort	Up to 2x improvement
Creator control	Fully manual	Human approval retained at key stages

This comparison will be formally validated during the controlled pilot using the MVP success scorecard.

3. MVP Objective

Objective Area	MVP Objective
Speed	Convert selected raw stories into creator-approved draft reels faster
Efficiency	Reduce repetitive manual effort in scripting, scene planning, prompts, and draft preparation
Quality	Maintain factual accuracy, creator control, and content quality
Scalability	Create a repeatable process that can support higher weekly content output
MVP Hypothesis We believe that an AI-assisted reel-production workflow for Agent R will reduce active manual effort and improve draft turnaround time while maintaining usable output quality.	

4. Target User and User-Centered Design

Area	Definition
Primary user	Content creator or reel-production owner
User goal	Convert a selected story into a creator-review-ready draft reel quickly
Current pain	Too much repetitive work across scripting, scenes, prompts, visuals, and timing
Desired outcome	Spend more time reviewing creative choices and less time preparing repetitive drafts
Design principle	Design around the creator workflow, not around AI features

5. MVP Scope

In Scope	Purpose
----------	---------

In Scope	Purpose
Raw story input	Start from a story, article, case, or concept
Story structuring	Convert raw information into a clear story flow
Script draft generation	Reduce first-draft writing effort
Scene breakdown	Convert script into visual scenes
Image prompt generation	Reduce manual prompt-writing effort
Visual generation support	Prepare image options for review
Dialogue and caption timing	Support reel pacing and edit preparation
Draft reel package	Create a creator-review-ready output
Human approval checkpoints	Keep creator control at important stages

Out of Scope for MVP	Reason
Automatic publishing	Final publishing must remain creator-controlled
Fully autonomous fact approval	Factual accuracy needs human verification
Virality prediction	Engagement depends on platform and audience factors
Fully automated final editing	MVP focuses on draft-readiness, not replacing final creative control
Multi-user platform	First MVP validates workflow before scaling

6. Proposed MVP Workflow

Workflow
Raw Story Input -> AI-Assisted Story Summary -> Creator Fact Review -> AI-Generated Reel Script -> Creator Script Approval -> AI Scene Breakdown -> Creator Scene Approval -> AI Image Prompts -> Visual Generation and Selection -> Dialogue / Caption Timing -> Draft Reel Preparation -> Final Creator Review

AI Will Assist With	Human Will Control
Structuring the story	Verifying important facts
Drafting the script	Approving or editing the script

AI Will Assist With	Human Will Control
Breaking the story into scenes	Selecting or correcting scenes
Creating image prompts	Approving visuals
Preparing caption/dialogue timing	Reviewing pacing and tone
Creating draft output	Final approval before publishing

Human-in-the-Loop Principle

AI will support the workflow. It will not independently approve facts, publish content, or override creator judgment.

7. MVP Test Completed: 10 Sample Videos

An internal MVP test was conducted using 10 sample videos to check whether the workflow can support real reel production use cases.

Test Area	What Was Evaluated
Script generation	Whether the AI-generated script was usable after review
Scene breakdown	Whether scenes matched the story flow
Prompt quality	Whether image prompts were clear and usable
Visual fit	Whether generated visuals supported the scene requirement
Rework requirement	Whether the output needed minor edits or major rebuilding
Creator control	Whether review checkpoints were sufficient
Workflow feasibility	Whether the process could be repeated across multiple videos

Evidence Position

The 10-video test shows that the workflow is feasible for a controlled MVP. The next step is to formally measure time saved, rework reduction, and creator-approved draft rate using the defined MVP scorecard.

Detailed evidence from the initial 10-video internal test is included in the accompanying Proof of Value document. This MVP document focuses on the pilot scope, success metrics, workflow controls, and scale decision criteria.

8. North Star Metric

North Star Metric
Percentage of selected raw stories converted into creator-approved draft reels within 3 hours, without major rework.

Dimension	Why It Matters
Speed	Measures whether drafts are created faster
Quality	Ensures the output is usable, not just generated
Creator control	Requires creator approval before success is counted
Business value	Links the workflow to higher production capacity
Reliability	Tests whether the process works repeatedly

9. MVP Success Scorecard

Metric Category	Metric	Baseline / Current State	MVP Target
North Star	Raw stories converted into creator-approved draft reels within 3 hours	Establish during controlled pilot	80%+
Outcome	Creator-approved draft rate	Establish during controlled pilot	80%+
Speed	End-to-end draft turnaround time	Approx. 3.5-6+ hours manually	1.5-3 hours
Efficiency	Active human effort per reel	Establish during controlled pilot	40-60% reduction
Quality	First-pass script acceptance rate	Establish during controlled pilot	70%+
Quality	Scene-plan acceptance rate	Establish during controlled pilot	70%+
Rework	Major rework rate	Establish during controlled pilot	Below 20%
Reliability	Workflow completion success rate	Establish during controlled pilot	90%+
Adoption	AI-assisted output adoption rate	Establish during controlled pilot	70%+
Satisfaction	Creator satisfaction score	Establish during controlled pilot	4/5+
Business Impact	Weekly draft-reel capacity	Establish during controlled pilot	Up to 2x improvement

Metric Category	Metric	Baseline / Current State	MVP Target
Cost	Cost per approved draft reel	Establish during controlled pilot	Lower than manual baseline

10. Counter Metrics and Guardrails

The MVP should not be considered successful only because it is faster. Speed must not reduce trust, quality, or creator control.

Main Improvement	Counter Metric
Faster draft creation	Material factual error rate must remain zero in approved drafts
Lower manual effort	Creator satisfaction must not reduce
Higher output capacity	Major rework rate must remain below 20%
More AI assistance	Human approval must remain 100% at key stages
More visual generation	Visual consistency issues must not increase
Lower cost	Output quality must remain acceptable

Guardrail Statement
The MVP will not be considered successful if speed improves but factual accuracy, creator control, or final draft usability declines.

11. AI Quality Evaluation

Because Agent R uses AI-generated scripts, scenes, prompts, and visuals, output quality must be evaluated separately from normal workflow speed.

Quality Area	Evaluation Method	Target
Factual accuracy	Creator verifies names, sequence, claims, and story facts	No material factual errors in approved drafts
Script relevance	Script is compared against original story	4/5 average
Hook strength	Opening is reviewed for reel suitability	3.5/5+
Dialogue quality	Dialogues are checked for clarity and natural flow	4/5 average
Scene alignment	Scenes are checked against script meaning	4/5 average

Quality Area	Evaluation Method	Target
Visual consistency	Characters, location, and style remain reasonably consistent	3.5/5+
Editability	Creator can correct one stage without restarting	4/5 average
Safety	Sensitive topics are reviewed before final output	100% review required

12. User Stories

1. As a creator, I want to enter a raw story so that I can quickly convert it into a structured reel concept.
2. As a creator, I want the system to generate a draft script so that I do not need to write the first version manually.
3. As a creator, I want to review and edit the script so that the final reel matches my tone and judgment.
4. As a creator, I want the system to break the script into scenes so that visual planning becomes faster.
5. As a creator, I want image prompts for each scene so that visual creation becomes easier and more consistent.
6. As a creator, I want to approve or reject visuals so that unsuitable images do not enter the final draft.
7. As a creator, I want caption and dialogue timing support so that the reel becomes easier to edit.
8. As a creator, I want the ability to regenerate only the failed stage so that I do not need to restart the full workflow.
9. As a creator, I want final approval control so that no reel moves forward without my review.

13. Usability Testing Plan

Test Area	Question
Ease of use	Can the creator move from story input to draft review without confusion?
Speed	Does the workflow reduce active creator effort?
Output quality	Are the script, scenes, prompts, and visuals usable?
Control	Can the creator approve, reject, or edit outputs at key stages?
Trust	Does the creator feel confident using the output as a draft?

Usability Metric	MVP Target
Task completion rate	90%+

Usability Metric	MVP Target
Regeneration success rate	80%+
Creator satisfaction score	4/5+
Average review time	Reduce over iterations

14. A/B Testing Plan

Test	Version A	Version B	Success Metric
Workflow comparison	Manual reel preparation	AI-assisted preparation	Time saved, active effort reduction, creator-approved draft rate
Prompt comparison	Basic prompt structure	Standardized Agent R prompt structure	First-pass script acceptance, scene acceptance, rework rate

15. Risk Management

Risk	Impact	Mitigation
AI adds unsupported facts	High	Mandatory human fact review
Script quality varies	Medium	Script approval checkpoint and scoring rubric
Scene does not match story	Medium	Scene-level creator review
Visuals are inconsistent	Medium	Regenerate only affected scene
Sensitive topic is mishandled	High	Safety review before final draft approval
Workflow breaks midway	Medium	Save progress and resume from failed stage
Creator loses control	High	Human approval required at key stages
Quality drops over time	Medium	Track prompt version and output quality

16. Responsible AI Principles

Principle	Agent R MVP Implementation
Human Oversight	Creator approves facts, script, visuals, and final draft
Explainability	Creator can see why each scene, prompt, or script section was suggested
Accountability	Final content decision remains with the creator
Safety	Sensitive content requires review before final use
Traceability	Prompt versions, edits, approvals, and failures are logged
Control	Creator can accept, edit, reject, or regenerate outputs

17. QA Plan

QA Area	What Will Be Checked
Input handling	Short, long, incomplete, and sensitive stories
Script output	Accuracy, length, tone, and reel suitability
Scene breakdown	Correct sequence and alignment with script
Image prompts and visual output	Prompt clarity, scene relevance, and visual consistency
Draft package and error handling	Timing, captions, completeness, failed generation, and recovery flow
Approval flow and logging	Required approvals, timestamps, edits, prompt versions, and failures

18. Feedback Loop

Feedback Type	How It Will Improve the MVP
Script edits	Improve script prompt structure
Scene corrections	Improve scene planning logic
Visual rejections	Improve image prompt quality
Timing corrections	Improve caption and dialogue pacing
Rework reasons	Identify weak workflow stages
Creator satisfaction	Validate whether the workflow feels useful

19. Launch Plan

Recommended next step: Run a controlled pilot across 15–20 selected new stories over 2–3 weeks to formally measure draft turnaround time, active creator effort, creator-approved draft rate, rework rate, factual accuracy, and workflow reliability.

Phase	Purpose	Output	Exit Gate
Phase 1: Baseline	Measure manual workflow effort	Current time and rework baseline	Baseline recorded
Phase 2: Internal MVP Test	Test workflow on 10 sample videos	Feasibility and quality review	Major issues identified
Phase 3: Controlled Pilot	Use AI-assisted workflow on selected new stories	Measured performance data	Success metrics achieved
Phase 4: Refinement	Improve prompts and workflow based on feedback	More reliable repeatable process	Rework reduced
Phase 5: Scale Decision	Decide whether to expand usage	MVP conclusion	Scale, improve, or stop decision

20. Change Management

Change Area	Approach
Workflow adoption	Start with selected stories only
Creator confidence	Keep human approvals visible
Quality assurance	Use clear review checklists
Process shift	Move from manual-first to AI-assisted-first drafts
Training need	Document prompt structure and review steps
Scaling	Expand only after successful pilot metrics

21. ROI and Business Impact

Value Lever	Expected Benefit
-------------	------------------

Value Lever	Expected Benefit
Time saved	Faster movement from raw story to draft reel
Manual effort reduced	Less repetitive scripting, scene planning, and prompt writing
Rework reduced	Early review checkpoints catch issues sooner
Output capacity	More draft reels can be prepared per week
Consistency	Standardized workflow improves repeatability
Cost efficiency	Lower effort cost per approved draft
Creator control	Human approval protects quality and brand judgment

ROI Logic

Time saved per reel = Manual active effort per reel - AI-assisted active effort per reel

Monthly hours saved = Time saved per reel x reels produced per month

Cost per approved draft = Tool cost + creator effort cost / approved draft reels

The MVP does not promise viral growth. It focuses on improving the speed, consistency, and scalability of reel production while preserving creator quality standards.

22. MVP Decision Rule

- At least 80% of selected stories become creator-approved draft reels.
- Draft turnaround time reduces toward the 1.5-3 hour target.
- Active human effort reduces by at least 40%.
- Major rework remains below 20%.
- Workflow completion reaches at least 90%.
- No approved draft contains material factual errors.
- Human approval remains active at all critical stages.

Scale / Improve / Stop

If the MVP meets these criteria, the workflow can be refined and scaled. If the MVP misses the criteria, the next step will be to improve prompts, review checkpoints, or workflow reliability before expanding usage.

23. Final Approval Ask

Approve a controlled Agent R MVP pilot using selected stories to formally measure draft turnaround time, active effort reduction, creator-approved draft rate, rework rate, and output quality before scaling the workflow further.

The MVP is intentionally designed as a low-risk, human-controlled AI-assisted workflow. It focuses on measurable productivity improvement, not uncontrolled automation.
